

Nexterna Clearview Link is a data import/export application used to transfer information between the Nexterna Clearview system and other software using XML. Since document tags and their structural relationships can be clearly defined in XML, users can import/export information quickly and easily. With Nexterna Clearview Link, companies can take advantage of Nexterna Clearview's extensive service management capabilities, and move information in and out based on their requirements.

Overview

Nexterna Clearview Link combines proven business logic with XML, a universal data exchange file format, to deliver advanced import and export functionality. It acts as an interface between external systems, allowing discrete sets of information to be passed back and forth at scheduled intervals or on demand.

With Nexterna Clearview Link, companies can integrate their business processes by sharing logistics, contract, and general information among various back-office systems. Data is transferred through Clearview in XML format, making it possible to share information between systems that may otherwise not be compatible.

Data Importing

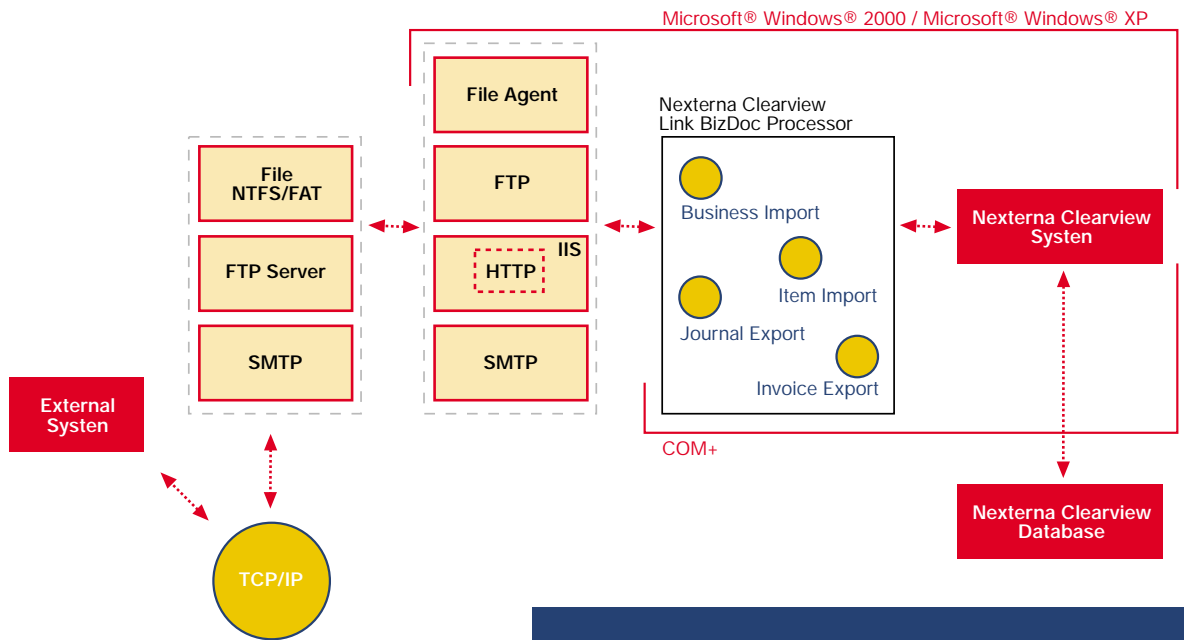

Import capabilities allow Nexterna Clearview to leverage core information that already exists in other back-office applications. It saves time and reduces administrative costs by eliminating the need to enter the same details into each system separately. While the type of information captured for import can be customized to fit each company's requirements, a few of the standard imports include:

- General information regarding the business and taxes
- Logistical details including: item listings, inventory transfers, purchase orders, and warehouse rules
- Contract status for specific products

Data Exporting

Export capabilities make it easy to tie the service-based information generated by Nexterna Clearview into other areas of the business. Rather than keeping service cost and revenue transactions separate, this information can be quickly transmitted to external financial and ERP systems for fast, accurate service billing. Data exports can be customized to fit the needs of each company. A few of the standard exports include:

- General information such as invoices and journal entries
- Logistical details including: item availability, stock amounts by warehouse, and item usage by warehouse

Benefits

Nexterna Clearview Link helps companies ensure accurate and consistent data across their entire organization – from services to financials. Exchanging information between disparate back-office systems eliminates the need to enter data more than once, reduces the risk of service and financial errors, and shortens billing cycles. Through the use of XML and Nexterna's proven business logic, companies can take advantage of best-of-breed applications, while still reaping the benefits of an integrated system.

About Nexterna

Nexterna, Inc. provides wireless mobile resource management solutions that help Field Service organizations increase productivity, lower operating costs, and improve customer satisfaction.

About Nexterna Clearview

Nexterna Clearview is a complete field service management application that is seamlessly integrated with GPS tracking and mobile communication systems. The Nexterna Clearview system is fully web-based, wirelessly enabled, and includes integrated mapping. It allows field service technicians to work together in real-time with the central office.

The Nexterna Clearview web-based application includes in-depth modules for service order management, sales order management, call avoidance, optimized dispatch with integrated mapping, contracts and preventative maintenance, product/asset tracking, and logistics and reverse logistics.

The Nexterna Clearview application can be deployed as part of a complete real-time service management system that includes the following optional modules: integrated mobile service management software, field web access, customer web access, data import/export, wireless data connectivity, and real-time vehicle location using GPS technology.
